

SAP warehouse management

Optimize efficiency with an integrated end-to-end system

SAP extended warehouse management (SAP EWM) is an integrated and holistic management system, offering a solution for all industries. All products can be planned, purchased, stored, transported and delivered via its central platform. It allows you to control inventory while optimizing processes to maximize efficiencies, smoothly integrating with SAP S/4HANA and SAP ERP.

The business challenges of warehouse management

Logistics does not end at the ramp, but does not start there, either – all goods movements must be planned, controlled and monitored. In an interconnected and digitalized world, full control of your warehouse supply chain is essential.

The rise of an end-to-end digital supply chain was inevitable. This is the only way to accelerate production and logistics processes, reduce complex data entry and improve data security and consistency.

The SAP EWM solution is specifically designed for businesses using SAP S/4HANA or SAP ERP to optimize their internal business processes and enhance overall performance.

Körber SAP consultants can address the logistics requirements and challenges of each individual business, and help ensure their logistics planning integrates tightly and seamlessly with their SAP system, and that they're thoroughly proficient in all SAP logistics applications, with both logistics and industry-specific automation and hardware experts on hand.

Key benefits

Thorough integration

SAP logistics and industry-specific automation, completely integrated with SAP S/4HANA, SAP ERP and SAP Supply Chain Logistics.

Process optimization

Warehouse planning and process execution made simple, efficient and transparent.

Flexible modeling

SAP Material Flow System optimizes routes and processes to allow a system to work to its full capacity.

SAP integrated warehouse logistics solution

SAP EWM offers a future-proof system with comprehensive support for logistics processes and full transparency over stocks and business processes. This enables businesses to optimize their internal processes and enhance their overall performance.

Our solution provides integrated, holistic logistics processes for all industries. All products can be planned, purchased, stored, transported and delivered via a central platform.

Körber is very experienced when it comes to complex and highly automated warehouses. Our experience extends to both greenfield (new) and brownfield (existing) sites, and migrating systems over to SAP Warehouse Management.

SAP provides a common platform approach, a “homogenous landscape” which enables not only complete and seamless integration, but also minimal support coverage for numerous systems. The standard solution is highly customizable, to meet the exact needs of each individual customer.

SAP Warehouse Management Material Flow System optimizes everything from automatic storage and conveyor technology systems to transport routes, interleaving, and dynamic transport destination allocation. All of this helps to ensure that equipment is utilized to its full capacity, leading to maximum performance and return on investment. Complex intralogistics equipment can also be directly coupled to the SAP system, further promoting transparency and efficiency.

Körber has mastered the necessary technology and tools (e.g. MobSys integration for scanning in the warehouse) as well as the latest in new and innovative approaches (e.g. SAP Fiori). With our deep expertise in material flow control and complex automated warehouse projects, Körber is one of the focus companies for SAP themselves in Europe as a best practice example.

The Körber difference

Seamlessly integrating with SAP ERP and the SAP Supply Chain Logistics suite, the SAP EWM solution can easily be extended with our SAP-based Add-ons, making it the perfect complement for the professional and digitized control of your supply chain, and ensuring you are prepared for tomorrow’s logistical requirements.

As a strong SAP partner, we have been repeatedly awarded various SAP partnerships since 2005 (e.g. SAP Recognized Expertise Partner in Supply Chain Management). We’re also heavily involved in early testing of new versions and improvements of products. We make the most of this status as a “Ramp Up” partner to learn early on about all the solutions coming to the market, before they are available for general release – keeping us, and our customers, continually ahead of the curve.

The SAP Supply Chain Logistics suite is ready for the future, to manage every aspect of supply chain logistics and order fulfillment. Due to our extensive offering of SAP solutions and SAP-based software Add-ons, we can consult and deploy without bias and prioritize the benefits for the businesses.

“Many of our customers run SAP worldwide. This means every warehouse and every transport management solution needs to be SAP-based. As an international company, we can deploy these solutions on a global scale. That’s something not a lot of our competitors can do.”
